                                                                                                                                                                                                                                                                                                                                                                                                                                      US-08-468-540B-18

US-08-468-540B-18

Sequence 18, Application US/08468540B

Patent No. 5858890

GENERAL INFORMATION:

APPLICANT: Weiner, Howard

APPLICANT: Hafler, David

APPLICANT: Al-Sabagh, Ained

TITLE OF INVENTION: SUPPRESSION OF T-CELL PROLIFERATION

TITLE OF INVENTION: USING PEPTIDE FRAGMENTS OF MYELIN BASIC PROTEIN

NUMBER OF SEQUENCES: 25

CORRESPONDENCE ADDRESS:

ADDRESSEE: Darby & Darby P.C.

STREET: 805 Third Avenue
                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 3, Application US/08640344

Patent No. 5824315

GENERAL INFORMATION:
APPLICANT: NUKKU, PRABHA

APPLICANT: NUKKU, PRABHA

TITLE OF INVENTION: IMPROVING BINDING AFFINITY OF ANTIGENIC

TITLE OF INVENTION: PEPTIDES FOR MHC MOLECULES

NUMBER OF SEQUENCES: 18

CORRESPONDENCE ADDRESS:
ADDRESSEE: TOWNSEND & TOWNSEND & CREW LLP

STREET: TOWNSEND & TOWNSEND & TOWNSEND
CITY: SAN FRANCISCO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The Contribution of phosphorylation and loss of COOH-terminal
The contribution of the COOH of Market arrangement of the myelin membrane in the COOH as a role in both the formation and stabilization of this compact multilayer arrangement of bilayers.

Each splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).

CHOBONIT: Homodimer (By similarity).

CHOBONIT: Homodimer (By similarity).

CHOBONIT: Homodimer (By similarity).

CHOBONIT: Homodimer (By similarity).

CHOBONIT: SubCAPTION: Cytoplasmic side of myelin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This Swiss-Prot entry is copyright. "Encephalitogenic fragment of myelin basic protein. Amino acid
"stequence of bovine, rabbit, guinea pig, monkey, and human fragments.";
J. Biol. Chem. 246:4630-4640(1971).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nervous system.

PIPI: At least 5 charge isomers; C1 (the most cationic, least modified, and most abundant form), C2, C3, C4 and C5 (the least cationic form); are produced as a result of optional posttranslational modifications such as phosphory/ation of serine or threonine residues, deamidation of glutamine or apparagine residues, citrullination and methylation of arginine residues. C1 and C2 are unphosphorylated, C3 and C4 are monophosphorylated and C5 is phosphorylated at two positions. SIMILARITY: Belongs to the myelin basic protein family.
Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NUCLEOTIDE SEQUENCE OF 7-156.

                                                                                                                                                                                                           myelin basic protein.",
J. Biol. Chem. 258:390-937(1983).

-! FUNCTION: 18, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bilayers. Each splication of this compact multilayer arrangement of bilayers. Each splication in the assembly of an optimized, biochemically functional myelin membrane (By similarity).
-! SUBGUNIT: Homodimer. (By similarity).
-! SUBGURITAR LOCATION: Cytoplasmic side of myelin.
-! TISSUE SPECIFICITY: Found in both the central and the peripheral
                                               human fragments.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 as a result of optional posttranslatonial modifications, such as phosphorylation of serine or threonine residues, deamidation of glutamine or asparagine residues, citrullination and methylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nervous system.
PTM: As in other animals, several charge isomers may be produced

PTM: At least 6 charge isomers; C1 (the most cationic and least modified form), C2, C3, C3, C5 and C6 (the least cationic form); are produced as a result of optional posttranslatonial modifications, such as phosphorylation of serine or threonine residues, desmidation of glutamine or asparagine residues, citrullination and methylation of arginine residues.

SIMILARITY: Belongs to the myelin basic protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PANTHER; FTHR1429; Wyelin BP; 1.

-!- FUNCTION: Is, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bilayers. Bach splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).
-!- SUBGNIT: Homodimer (By similarity).
-!- SUBGILULAR LOCATION: Cytoplasmic side of myelin.
-!- SUBCILULAR LOCATION: Cytoplasmic side of myelin.
-!- subcomment of several charge isomers may be produced as a a result of optional posttranslatonial modifications, such as phosphorylation of serine or threonial modifications, such as plutamine or apparagine residues, citrullination and methylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This Swiss-Prot entry is copyright. Kira J.-I., Deibler G.E., Krutzach H.C., Martenson R.E.;
J. Neurochem. 44:1653-165(1985).

-!- FUNCTION: 18, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bilayers. Each splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCLIULIAR LOCATION: Cytoplasmic side of myelin.
-!- PTM: As in other animals, several charge isomers may be produced as a result of optional posttranslatonial modifications, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

N.Alternate names: myelin Al protein
N.Contains: myelin basic protein amide 14
N.Contains: myelin basic protein amide 14
C.Species: Sus scrofa domestic domestic pig)
C.Date: 19-Apr-1996 #sequence_revision 26-Apr-1996 #text_change 09-Jul-2004
C.Accession: A61640; A36245
R.Kira, J.: Deibler, G.E.; Krutzsch, H.C.; Martenson, R.E.
J. Neurochem, 44, 134-142, 1985
A.Title: Amino acid sequence of porcine myelin basic protein.
A.Reference number: A61640; MUID: 85056964; PMID: 2578056

The present invention relates to a novel method for inducing Th2 immune responses to Myelin Basic Protein (MBP) or a peptide analogue of MBP in a patient. The method involves administering a composition comprising the MBP peptide analogue CGP 77116 (NBI-5788). The method is useful for treating multiple sclarosis (MS). Sequences of the invention are also used as vaccines. The present sequence is a peptide related to human MBP
of the invention of peptide region 83-99 of Myelin basic protein (MBP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Inducing Th2 immune responses to Myelin Basic Protein (MBP) by administering the MBP peptide analog CGP 77116, useful for treating

                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for selecting a tolerogenic peptide, comprising selecting a peptide which is capable of binding to a major histocompatibility complex (MHC) class I or II molecule without further processing. The peptides of the invention are useful for preventing a disease such as hypersensitivity disorder, and also for treating and/or preventing a disease. In a subject. The method involves identifying an antigen for the disease, identifying an apitope (antigen processing independent epitope) for the antigen, and administering the apitope to the subject. The peptides of the invention are also useful for treating allergies such as extrinsic asthma, atopic dermatitis, allergic rhinitis, utricaria, autoimmune diseases such as multiple sclerosis, autoimmune transmers and such as multiple sclerosis, autoimmune transmers, systemic sclerosis, arcoidosis, autoimmune transmit polymyositis, diabetes, etc, and transplant rejection. The peptides are also useful for modifying antiviral CD8+ responses in a tolerogenic fashion. This sequence represents an apitope

Immunoabsorption column, useful for treating multiple sclerosis, contains glycopeptides able to react with disease-specific autoantibodies.
                                                                                                                                                                                                                                                                                                                                                                                     containing conjugates comprising glycopeptides which are able to recognize antibodies implicated in multiple sclerosis. The column removes harmful antibodies selectively, leaving all other components of the serum unchanged. The column is used to treat multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                ABP97937-44 represent glycopeptides of a formula given in the specification. The glycopeptides are used to produce columns of the invention. The specification describes immunoabsorption columns,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Glycopeptide #5 for diagnosis and treatment of multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel glycopeptides comprising a specific tetrapeptide, useful as diagnostic tools for identifying multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Glycopeptide; neuroprotective; autoantibody; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide used in the treatment of autoimmune disease e.g. multiple sclerosis (MS). More particularly, it concerns a Toell receptor sequence found in some MS patients and methods for its detection. T cell receptors comprise alpha and beta chains, with beta chains comprising the following regions from N-terminus to C-terminus: Vbeta-Dbeta-Dbeta-Dbeta-Dbeta T cell receptors naturally vary in the Vbeta-Dbeta-Dbeta-Dbeta Grown The peptides of the invention are used for treating autoimmune disease e.g multiple sclerosis. The present sequence is a peptide analogue used in the exemplification of the invention
                                                                                Autoimmune disease; multiple sclerosis; MS; Jbeta; Cbeta; Ubeta; Dbeta; immunosuppressive; T-cell receptor; therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The invention discloses a method for inducing a Th2 immune response to myelin basic protein or its peptide analog in a patient, comprising administering a composition comprising a peptide analog in combination with a carrier/adjuvant or diluent. The peptide analog comprises at least of amino acids selected from residues 83 to 99 of human myelin basic protein, where it he L-1ysine at position 91, L-arginine at position 97 or L-threonine at position 95, is altered to another amino acid, and one to three L-amino acids selected from valine at position 86 or 87, histidine at position 88, threonine at position 95 or 98, and proline at position or three L-amino acids selected from valine at position 95 or 99, are altered or an amino acid other than the amino acid present in the pative protein at that position or the L-1ysine at position 91 is altered to another amino acid and the N- and/or C-terminal amino acid are altered to another amino acid and the N- and/or C-terminal amino acids and one to four additional altered residues. The N-terminal amino acids and one to four additional altered residues. The N-terminal amino acids and one to four additional altered residues. The N-terminal additional L-amino acids selected from residues 81 to 90 and 92 to 99 is substituted with a charged amino acid. The method is useful for treating multiple sclerosis using peptide analogs of human myelin basic protein. The sequence presented is the wild-type human myelin basic protein. The sequence presented is the wild-type human myelin basic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inducing a Th2 immune response to myelin basic protein or its peptide analog in a patient, useful for treating multiple sclerosis, comprises administering an amount of a pharmaceutical composition comprising a
basic protein minimal epitope which can be used in a fusion protein of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, Th2; immune response; myelin basic protein; peptide analog;
proteolysis; multiple sclerosis; neuroprotective; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (ITIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgB receptor (FeepsilonR). Also provided are nucleotide sequences encoding such a fusion protein. The fusion molecules and compositions are useful for treating an IgE-mediated biological response, preferably an IgE-mediated fusion protein, such as asthma, allergic rhinitis, atopic dermatitis, severe food allergies, chronic urticaria, angioedema or anaphylactic shock; or autoimmune diseases such as rheumatoid arthritis, chapting from, a type I hyporsensitivity reaction in a subject receiving immunotherapy. The present sequence is the human myelin
                                                                                                                                                                                                                                                                                       ö
                                                   The present invention relates to glycopeptides (ABR56059-ABR56066). The glycopeptides have high specificity in recognizing autoantibodies involved in multiple sclerosis pathology, and thus are effectively used in diagnosis and treatment for multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  comprising polypeptide sequences that bind to IgG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a composition comprising at least one peptide

having an isolated, prepared epitope selected from any of the sequences

from 30 lists given in the specification. Also disclosed is a method for

inducing a cytotoxic T cell response against a pre-selected antigen in a

c patient expressing a specific MHC class I allele by contacting cytotoxic

composition comprises an epitope that is joined by an amino acid linker.

C composition comprises an epitope that is joined by an amino acid linker.

The epitope is admixed or joined to a CTL or HTL epitope. The epitope is

bound to an HLA molecule on the antigen-presenting cell, where when an A2

creatricted cytotoxic Imphocyte (CTL) is present, a receptor of the CTL

binds to a complex of the HLA molecule and the epitope. Specifically

claimed are peptides having allele-specific binding motifs for HLA. The

compositions and methods are useful for preventing, treating or

ciamed agents for evaluating immune responses, for making antibodies

diagnostic agents for evaluating immune responses, for making antibodies

and for evaluating efficacy of a vaccine. Sequences given in ADM29251-

having an isolated, prepared epitopes selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic T cell response against a pre-selected antigon in a patient expressing a specific MFC class I allele by contacting cytotoxic composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a TL or HTL epitope. The epitope is bound to an HLA molecule and the epitope. The epitope is bound to an HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnosing viral diseases and cancer. The peptide epitopes are useful as diagnosing viral diseases and cancer. The peptide epitopes are useful as and for evaluating efficacy of a vaccine. Sequences given in AbW3251-ADW3775 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Virucide; cytostatic; gene therapy; vaccine; epitope; cytotoxic T cell; MHC class I; CTL; HTL; A2-restricted cytotoxic lymphocyte; HLA; viral disease; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a composition comprising at least one peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytocoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic T cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is from tha molecule on the antigon-presenting cell, where when an A2-restricted cytocoxic lymphocyte (CTL) is present; a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnosing viral diseases and cancer. The peptide epitopes are useful as diagnosing viral diseases and cancer. The peptide epitopes are useful as and for evaluating efficacy of a vaccine. Sequences given in ADW29221.

ADW37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The present invention is direct to methods of isolating antigen specific comprises inclubating a sample of T cells obtained from a patient with the comprises inclubating a sample of T cells obtained from a patient with the antigen and selecting T cells that express one or more of first markers cantigen and selecting T cells that express one or more of first markers cantigen and selecting T cells that express one or more second markers selected from interleukin-2, interferongamma, tumour necrosis factor alpha, interleukin-2, interferongamma, tumour necrosis can the pathogenesis of autoimmune diseases. The methods also permit the disease and for monitoring the efficacy of treatment. The methods are preparation of autologous T cells which play a role the disease and for monitoring the efficacy of treatment. The methods also paration of autologous T cell vaccines for the treatment of the disease and for monitoring the proparation of autoimmune diseases. The monitoring the progression of the proparation of antigen-specific T cells optionally followed by culturing steps which allow the expansion of the population of solation of myelin-reactive T cells optionally followed by culturing specific T cells and expansion of the population of solation of myelin-reactive T cells for T cell vaccination. Peripheral blood of myelin-reactive T cells from the invention describes the isolation of patients and incubated with peptides comprising known immunodominant creamine and anno acide 110-126 of human myelin basic protein. Cells were comprises amino acide 110-126 of human myelin basic protein. The compositions of the invention are useful for the diagnosis cand/or treatment of autoimmune thyeaces es propagated in culture. The methods and compositions of the invention are useful for the diagnosis cand/or treatment of autoimmune thyeaces or T cell associated conditions of extrement and probated and promise and confined and charmance of autoimmune thyeins, specials is gisease, inflammatory human to be extremed to a propagated in cul
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The invention comprises a method of determining etiology of an autistic spectrum disorder in a patient. The method involves determining the level of an infectious agent, toxic chemical, or dietary protein derived antigen, or their antibodies in samples of patient, and comparing antigens/antibodies levels with normal levels of antigens/antibodies from control subjects. The method of the invention is useful for determining the etiology of an autistic spectrum disorder, such as autism, pervasive development disorder and Asperger's syndrome. The present amino acid sequence represents a peptide that was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                          Determining etiology of autistic spectrum disorder in patient, by determining level of infectious agent/toxic chemical/dietary protein derived antigen in samples of patient, comparing it with normal level of antigens of control subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            pharmaceutical; t-lymphocyte; antigen; multiple sclerosis; utcimmune disease; immunety; immune stimulation; immunity; autcoimmunity; immunosuppressiv; neuroprotective; antiarthritic; antirheumatic; antiinfalfammatory; myelin; myelin basic protein; MBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of diagnosing the likelihood and severity of demyelinating diseases. The method involves determining antibodies against neuron-specific antigen in sample, comparing the level of antibodies with the normal level of antibodies, where normal level of antibodies for heuron-specific antigen indicate optimal conditions, lower than or higher than normal level of antibodies for the antigen indicate of an absence of or a likelihood of demyelinating diseases, respectively.

The neuron-specific antigen is chosen from myelin basic protein (MBP), myelin oligodendrocyte glycoprotein, myelin ossociated glycoprotein, transaldolase, glial fibrillary protein, S-100 protein, cross-reactive peptide from dietary protein, cross-reactive peptide from dietary protein, cross-reactive peptide from dietary protein, and phosphodiesterase. The immunoassay is an enzyme linked immunosorbent assay (ELISA) test. The method is useful for diagnosing the likelihood and severity of demyelinating diseases such as multiple sclerosis in a patient. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Diagnosing likelihood and severity of demyelinating disease, by determining antibodies against neuron-specific antigen, comparing level of detected antibodies with normal level for detecting absence/likelihood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Complex peptide mixture having immunomodulatory effects, useful for preparing medicament for treating autoimmune disease e.g. multiple sclerosis, rheumatoid arthritis, for preparing medicament for stimulating immune cell.

Example; Page 22; 51pp; English

The invention relates to complex peptide mixtures comprises several peptides having 8-20 amino acids, where the mixture comprises peptides having 8-20 amino acids, where the mixture comprises peptides having a degree of diversity at defined positions in the peptide chain, where the degree of diversity in the defined position is different from other defined positions, and where in the majority of the mixture, the peptides includes Ala, Glu, Lys and Tyr and no other amino acids, in at least four positions. Also described are: (1) a method of creating a high affinity peptide ligand of a defined formula for a receptor of a T cell that is reactive to a myelin antigen, copolyamer, or an active mixture; and (2) a method of enhancing a biological property of a complex mixture of peptide mixture is useful in the preparation of a madicament for treating a disease such as multiple sclerosis (8S) and experimental autoimmune encephalomyelitis (EAE). It is also useful for preparing a medicament for stimulating an immune cell, or for suppression of an immune reaction (e.g. autoimmune reaction) to an antigen derived from myelin. This sequence represents a myelin peptide used in the examples of the present invention.
